TITLE:

Some New Data Concerning the Stratigraphy of the Triassic Deposits of the Nakhichevanskaya ASSR (Nekotoryye novyye dannyye o stratigrafii triasovykh otlozheniy Nakhichevanskoy ASSR)

PERIODICAL:

Doklady Akademii nauk SSSR, 1958, Vol 123, Nr 1, pp 156 - 158 (USSR)

ABSTRACT:

The Nakhichevanskaya Autonomous Soviet Republic and the neighboring districts of Armenia are the only areas in the Zakavkaz'ye (Transcaucasis) in which marine Triassic deposits of the Sredizemnomorskaya (Mediterranean) facies occur (Refs 1, 2, 6, 9 - 11). The author's new data both supplement our knowledge of Triassic stratigraphy and make it more precise. The author also proposes a new scheme for the subdivision of the Triassic. Lower Triassic: The transition from Permian to Triassic occurs without a sedimentary break. Nevertheless, the boundary between the Paleozoic and Mesozoic is very clear, faunally and lithologically. P. Bonnet assigned the package of light gray and reddish-pink limestones with *Otoceras aff. woodwardi* Griesb. to the

Card 1/4

Some New Data Concerning the Stratigraphy of the
Triassic Deposits of the Nakhichevanskaya ASSR

SOV/20-123-1-42/56

Upper Permian (Ref 2). The author considers these strata as the base of the Triassic, although they contain known Permian species. In his opinion they are species which are dying out, and such species should not be used for dating purposes in stratigraphy. More important is the appearance of new, Lower Triassic forms. Overlying the Otoceras strata is the characteristic Lower Triassic horizon consisting of red, irregularly stratified, marly limestones with a thickness of 5 to 20 m. This horizon contains a cephalopod fauna, all of whose characteristics show a close relationship to the Indian Province of the Tethian domain. This fauna suggests the Seyskiy and the Lower Kampil'skiy Stages of the Lower Triassic. It corresponds to the Ofitserovaya and Meyekotserovaya Zones, as well as the Lower Khedenstremiyevaya Zone of the Himalayan Triassic (Ref 4). The upper part of the Lower Triassic section consists of fine, platy limestone, which is 18 - 20 m thick and contains a fauna characteristic for the upper part of the Khedenstremiyevaya Zone of the Kampil'skiy Stage. Middle Triassic: Two divisions can be made on the basis of lithology: a) a lower part

Card 2/4

Some New Data Concerning the Stratigraphy of the
Triassic Deposits of the Nakhichevanskaya ASSR

SOV/20-123-1-42/56

which is 120 - 150 m thick and consists of finely laminated, platy, fissile, fucoidal and pisolithic limestone. These beds contain few fossils, and their age is determined only by their stratigraphic position. b) The upper part consists of massive limestones, which contain ooliths, are 35 - 40 m thick, and are sparsely fossiliferous. Upper Triassic: Again, two divisions can be made, which probably correspond to the Carnian and Norian Stages. The uppermost member of the Triassic section here is a massive dolomite and dolomitized limestone, which is 500 - 600 m thick and contains only a meager fauna. Due to the dearth of guide fossils in these dolomites, individual investigators have assigned different ages to them (Refs 1, 2, 7, 9). Considering strata of neighboring regions (Refs 3, 7), the author assumes that the upper boundary of these dolomites does not extend higher than the base of the Rhaetian. By considering their stratigraphic position and analogies in other districts of the Tethian domain, this dolomite formation would be assigned to the Norian Stage. There are 1 table and 11 references, 6 of which are Soviet.

TITLE: Effect of rare-earth metals on the casting properties of Kh21L high-chromium steel

SOURCE: Liteynoye proizvodstvo, no. 12, 1965, 7-8

TOPIC TAGS: chromium steel, cerium, rare earth metal, alloy, metal casting, metal property/Kh21L chromium steel, MM5 alloy

ABSTRACT: High-chromium steels display poor casting properties, which can be remedied by adding rare-earth metals (REM). In this connection, the author describes the results of an investigation of the effect of the addition of REM in the form of MM5 alloy on the casting properties of Kh21L steel (0.25-0.35% C, 20.0-22.0% Cr, 0.7-1.5% Si, 0.3-0.7% Mn, 0.03-0.05% P, 0.01-0.03% S and 0.1-0.15% Ti). Findings: the fluidity (as determined by the spiral test) of the REM-inoculated specimens is good: 600-840 mm over the standard spiral following the addition of 0.15-0.20% MM5 (~0.2% Ce). The deoxidizing capacity of REM is extremely high; thermodynamic calculations indicate that even 0.01% Ce is quite sufficient to completely reduce the Cr from the inclusion oxides. To elucidate this effect of REM on the fluidity of

ACC NR: AP6014342

Kh21L steel, the solidification temperature and linear shrinkage were investigated for specimens of this steel with and without REM: for REM-containing specimens the initial and final temperatures of solidification were higher while the linear shrinkage decreased from 2 to 1.3% which apparently is related to the strengthening of the interatomic bonds at higher temperatures. Treatment with REM apparently leads to greater ordering of particles at high temperatures and in liquid state; this leads to the formation of fairly compact crystal lattices with a minimum number of vacancies, whose parameters are close to their parameters at low temperatures, with the slight attendant change in volume manifesting itself in the form of insignificant shrinkage; for the same reason, REM reduce the proneness of Kh21L steel to the formation of hot cracks. TITLE: New Corrosion-resistant High-chromium Alloys for Casting
(Novyye korroziyonnostoykiye vysokokhromistyye splavy dlya otlivok)

PERIODICAL: Sb. statey Vses. n.-i. i konstrukt. in-t khim. mashinostr., 1957,
Vol 23, pp 14-37

ABSTRACT: The corrosion resistance of specimens and components was investigated in a concentrated 67% HNO₃ solution, in boiling 25% and 5% HNO₃ solutions, in a 93% H₂SO₄ solution, and in a 50% CH₃COOH solution; mechanical properties (σ_b , δ , and α_k), microstructure and fluidity of cast Cr-steels of the types 20Kh14L, 25Kh18L, 30Kh20L, and Kh28 were also investigated; this included steels containing additions of Cu (up to 1.5%) and Ti (up to 0.32%). It was established that an increase in Cr content beyond 23% (at 0.35% C) produces only a slight increase in the corrosion resistance of the metal in an HNO₃ solution. Addition of Cu and Ti did not have any effect. The new alloys 25Kh18L and 30Kh20L, which possess better casting and mechanical properties than Kh28 steel, are

Card 1/2

TITLE: Nickel-free steels for heat-stable castings

SOURCE: Mashinostroyeniye, no. 5, 1964, 33-34

TOPIC TAGS: metallurgy, metal testing, nickel steel, chromium steel, high temperature steel/ Kh21L steel, mischmetal

ABSTRACT: The qualities and properties of steels used in making objects for use at high temperatures are discussed. The disadvantages of chrome-nickel steels are cited in cases when oxidizing or carbonizing substances are present. The usually encountered disadvantages of brittleness and graininess of high-chrome steels are removed through a microalloying process. The properties of two steels with 20% chrome concentration were tested. One prepared with nitrogen, the other with mischmetal. The chemical compositions of the steels are presented in Table 1 on the Enclosure; the base steel used is type Kh21L. The specimen prepared with nitrogen showed very little tendency towards graininess, even when heated and held at 1000C for 100 hours. Hardness and shear strength tests yielded results which prompted recommendation of the steel for heat-stable castings. The specimen prepared with mischmetal was found to withstand factory conditions well. This was as

Card 1/3

L 16903-65

ACCESSION NR: AP4047690

a result of testing several sizes and shapes under the required factory circumstances. Additional discussion and results are presented for: 1) high-temperature flowability characteristics, 2) oxidation resistance, 3) microstructure, 4) welding ease, 5) impact strength, and 6) cost. Both steels were found to be satisfactory for the conditions imposed. Orig. art. has: 1 table.

TITLE: Theory of elasticity of nonhomogeneous medium

SOURCE: Prikladnaya matematika i mehanika, v. 28, no. 4, 1964, 601-611

TOPIC TAGS: solid mechanical property, differential calculus, integral calculus

Abstract: The equations of equilibrium of an isotropic nonhomogeneous medium, within which the moduli of elasticity are different from constant differentiable functions at a point, but whose Poisson ratio is a constant, are studied for the applicability of the methods of separation of variables and integral transforms. The author gives the equation of the stress function in isothermic coordinates and some examples. For the three-dimensional case he finds the sufficient conditions for the radial distribution of stresses. The case in which the modulus of elasticity is a power function of one of the rectangular coordinates is treated separately. In this case it was established that the fundamental functions for the planar problem of the strip will be confluent hypergeometric functions. The applicability of the Fourier method is considered in the three-

476. Calculation of a long d.c. transmission line
when its parameters depend on the sign of the potential.
N. A. ROSTOVSKY. Elektrichesvo, 1953, No. 5, 62-6.
In Russian.

Let a ring-type d.c. main have two "critical" points, of the following characteristics: a lumped conductance to earth at the first point, which is fixed and a discontinuity in leakage conductance at the second point which is assumed to be at zero potential. These conditions cannot be met if the co-ordinates of the second point is also given; it can only be found by calculation. It is also possible to find the current and power losses at the second point, as was shown by Podolskil, though under the artificial assumption of a current constant all over the line (corresponding to infinitesimal leakage and linear fall of the potential). The value of this solution is therefore problematical, since the conditions cannot be materialized. Apart from this, the method used, though elementary, is awkward to handle. The author shows, however, that the theory of long transmission lines supplies an exact solution. If the losses are small, the formulae obtained may be considerably simplified and the treatment becomes even more accurate and enables a discontinuity of the resistance and of the conductance at the point at zero potential to be considered.

ABSTRACT

Received 3/1957
PA - 2209
Reviewed 5/1957
The present work deals with the effective computation of the shifts and tensions in an elastic isotropic half-space $z \gg 0$ on the plane boundary of which $z = 0$ a rigid stamp with circular ground plan presses. Within the domain of the contact $x^2 + y^2 \leq a^2$ friction and interlinkage are assumed to be lacking. The surface of the stamp is assumed to be smooth and to satisfy the equation $z = P(x,y)$, where $P(x,y)$ is a polynomial of x and y . The present paper shows the following. If the aforementioned equation for the surface of the stamp is valid, tensions and shifts are expressed by means of elementary functions of the coordinates. Here a method is given for their computation in polar coordinates. The formulae for shifting contain a harmonic function $\psi = \psi(r,z,\varphi)$, the values of which at $z = 0$ and $r \leq a$ are known. The function ψ is then developed into a FOURIER series and a partial differential equation is given for the development coefficients $\psi_m(r,z)$: $(\partial^2 \psi_m / \partial r^2) + (1/r)(\partial \psi / \partial r) + (\partial^2 \psi / \partial z^2) = (m^2 / r^2) \psi_m$. This function $\psi(r,z)$ was already determined in the course of a previous work. Thus, the problem for $m \geq 1$ remains to be studied. One of the elementary solutions of this differential equation for $m \geq 1$ is the function $r^{-m} (r^2 + z^2)^{m-1/2}$, a sectorial spherical harmonic. By means of this elementary solution another solution is constructed which is not analytical on

PHASE I BOOK EXPLOITATION

16(1) 1956

Vsesoyuznyy matematicheskiy s"ezd. 3rd, Moscow, 1956
Trudy. t. 4: Kratkoye soderzhanie sektsionnykh dokladov. Doklady
iostrojennykh ucheniy (Transactions of the 3rd All-Union Mathe-
matical Conference in Moscow). Vol. 4: Summary of sectional Reports.
Reports of Foreign Scientists. Moscow, Izd-vo AN SSSR, 1959.
247 p. 2,200 copies printed.

PURPOSE: This book is intended for mathematicians and physicists.

SPONSORING AGENCY: Akademiya nauk SSSR. Matematicheskiy institut.
COVERAGE: The book is Volume IV of the Transactions of the Third All-
Union Mathematical Conference, held in June and July 1956. The
book is divided into two main parts. The first part contains sum-
maries of the papers presented by Soviet scientists at the Con-
ference that were not included in the first two volumes. The
second part contains the text of reports submitted to the editor
by non-Soviet scientists. In those cases when the non-Soviet scien-
tist did not submit a copy of his paper to the editor, the title
of the paper is cited and, if the paper was printed in a previous
volume, reference is made to the appropriate volume. The paper,
both Soviet and non-Soviet, cover various topics in number theory,
algebra, differential and integral equations, function theory,
functional analysis, probability theory, topology, mathematics,
problems of mechanics and physics, computational mathematics, and
mathematical logic and the foundations of mathematics, and the
history of mathematics.

TITLE: Certain solutions of an integral equation in the theory of a linearly deformed base

SOURCE: Prikladnaya matematika i mehanika, v. 28, no. 1, 1964, 111-127

TOPIC TAGS: integral equation solution, linearly deformed base, power kernel, Dirichlet problem, second order differential operator, Lame function, Newtonian potential theory

ABSTRACT: The author constructs an effective solution for the integral equation

$$w(x, y) = \iint p(\xi, \eta) K(r) d\xi d\eta \quad (r = \sqrt{(x-\xi)^2 + (y-\eta)^2})$$

for an elliptic domain in the case of the power kernel $K(r) = Cr^{-1-k}$. He relates (1) to the Dirichlet problem for a second order differential operator. This allows him to find the eigenfunctions of (1), which turn out to be contiguous ellipsoidal Lame functions. If $w(x, y)$ is a polynomial, he can compute $p(x, y)$ and thus obtain

Card 1/2

ACCESSION NR: AP4013385

a continuation of $w(x,y)$ beyond the limits of the region of integration. Incidentally he obtains formulas for computing certain integrals analogous to potentials, and he derives other results analogous to Newtonian potential theory and the theory of ellipsoidal Lamé functions. Orig. art. has: 96 formulas.

TITLE:

More Meat for the Country (Bol'she myasa strane)

PERIODICAL: Nauka i Zhizn', 1958, # 2, p 22 - 25 (USSR)

ABSTRACT:

Efforts will be made during the next few years to catch up with and surpass the US in the production of meat and butter. With regard to milk and butter of meat, milk reached in 1958 according to estimates of specialists, this goal will be the current Five-Year-Plan, the production of 11 million tons compared with 2.6 million tons produced in 1956. To carry out these plans it is highly important that methods of animal husbandry be approved.

A series of experiments carried out by scientific research institutes under the supervision of VASKhNIL showed, that a new synthetic preparation - diethyl stilboestrol - is very effective in increasing the production of meat. The addition to the fodder of carbamide containing organic nitrogen replaces part of the protein in the fodder. One ton of carbamide would yield 13 tons of meat.

A number of similar experiments aimed at increasing the weight of cattle were conducted at the initiative of VASKhNIL
